

Specops Secure Access

Service Specific Terms

Specops Secure Access provides multi-factor authentication (MFA) for Windows logon, Remote Desktop Protocol (RDP), and Virtual Private Network (VPN) connections. It supports multiple MFA methods, including Yubikey, Duo Security, the Specops:ID mobile app, and SMS, as well as offline authentication through one-time password (OTP) authenticators. The product enhances security for both online and offline access, protecting against unauthorized access attempts.

The Third-Party Authentication Package is an optional add-on for Specops Secure Access. It enables the use of supported third-party authentication services for user enrollment and verification.

Specops Secure Access is made available under an annual subscription agreement. The subscription is limited to the number of enabled Active Directory user objects within scope of a Specops Secure Access Cloud Policy or Specops Secure Access Group Policy Object (GPO) across all affected domains.

If SMS verification is configured as an available authentication method for users, SMS messages are not included in the annual subscription fee and will incur additional charges.
